I. Objectives

Introduction

A doubly linked list is a type of linked list data structure where each node contains three components:

Data - The actual value stored in the node
Previous pointer - A reference to the previous node in the sequence
Next pointer - A reference to the next node in the sequence.

This laboratory activity aims to implement the principles and techniques in:

- Writing algorithms using Linked list
- Writing a python program that will perform the common operations in a Doubly linked list
- A doubly linked list is particularly useful when you need frequent bidirectional traversal or easy deletion of nodes from both ends of the list.

II. Methods

- Using Google Colab, type the source codes below:

```
class Node:
    """Node class for doubly linked list"""
    def __init__(self, data):
        self.data = data
        self.prev = None
        self.next = None

class DoublyLinkedList:
    """Doubly Linked List implementation"""

    def __init__(self):
        self.head = None
        self.tail = None
        self.size = 0

    def is_empty(self):
        """Check if the list is empty"""
        return self.head is None

    def get_size(self):
        """Get the size of the list"""
```

```
    return self.size

def display_forward(self):
    """Display the list from head to tail"""
    if self.is_empty():
        print("List is empty")
        return

    current = self.head
    print("Forward: ", end="")
    while current:
        print(current.data, end="")
        if current.next:
            print(" ↔ ", end="")
        current = current.next
    print()

def display_backward(self):
    """Display the list from tail to head"""
    if self.is_empty():
        print("List is empty")
        return

    current = self.tail
    print("Backward: ", end="")
    while current:
        print(current.data, end="")
        if current.prev:
            print(" ↔ ", end="")
        current = current.prev
    print()

def insert_at_beginning(self, data):
    """Insert a new node at the beginning"""
    new_node = Node(data)

    if self.is_empty():
        self.head = self.tail = new_node
```

```
        else:
            new_node.next = self.head
            self.head.prev = new_node
            self.head = new_node

        self.size += 1
        print(f"Inserted {data} at beginning")

    def insert_at_end(self, data):
        """Insert a new node at the end"""
        new_node = Node(data)

Answer the following questions:

1. What are the three main components of a Node in the doubly linked list implementation, and what does the __init__ method of the DoublyLinkedList class initialize?
2. The insert_at_beginning method successfully adds a new node to the start of the list. However, if we were to reverse the order of the two lines of code inside the else block, what specific issue would this introduce? Explain the sequence of operations that would lead to this problem:

```
def insert_at_beginning(self, data):
    new_node = Node(data)

    if self.is_empty():
        self.head = self.tail = new_node
    else:
        new_node.next = self.head
        self.head.prev = new_node
        self.head = new_node

    self.size += 1
```

3. How does the reverse method work? Trace through the reversal process step by step for a list containing [A, B, C], showing the pointer changes at each iteration

```
def reverse(self):
    if self.is_empty() or self.head == self.tail:
        return

    current = self.head
    self.tail = self.head

    while current:
        temp = current.prev
        current.prev = current.next
        current.next = temp
```

```
        current = current.prev

    if temp:
        self.head = temp.prev
```

III. Results

Answers:

1. The three main components of that class is head, tail and size, the __init__ is used to initialize the parameters of the object this is connected to instance of the object in short there can be many multiple instances of it share some common parameters like the methods and variables but they are only isolated to the object itself so they don't share variable values so they have a individual identities from one and another but only belong in the same class.

2. If the two line s of code was reversed in the class method of DoublyLinkedList it's possible to be pointed in another node or None and creating a bugs or unpredictability to program that why the order of code is important if we want to accomplish its goal. So basically the order of it is apart of the algorithm design, altering it will cause undesirable effect that can cause a problem.

3. Basically they changed the next pointer from the previous node and use it as the next pointer of it and by doing this the head became a part of tail and the end of tail became the head of it this approach allow the linkedlist to be reversed it nodes order.

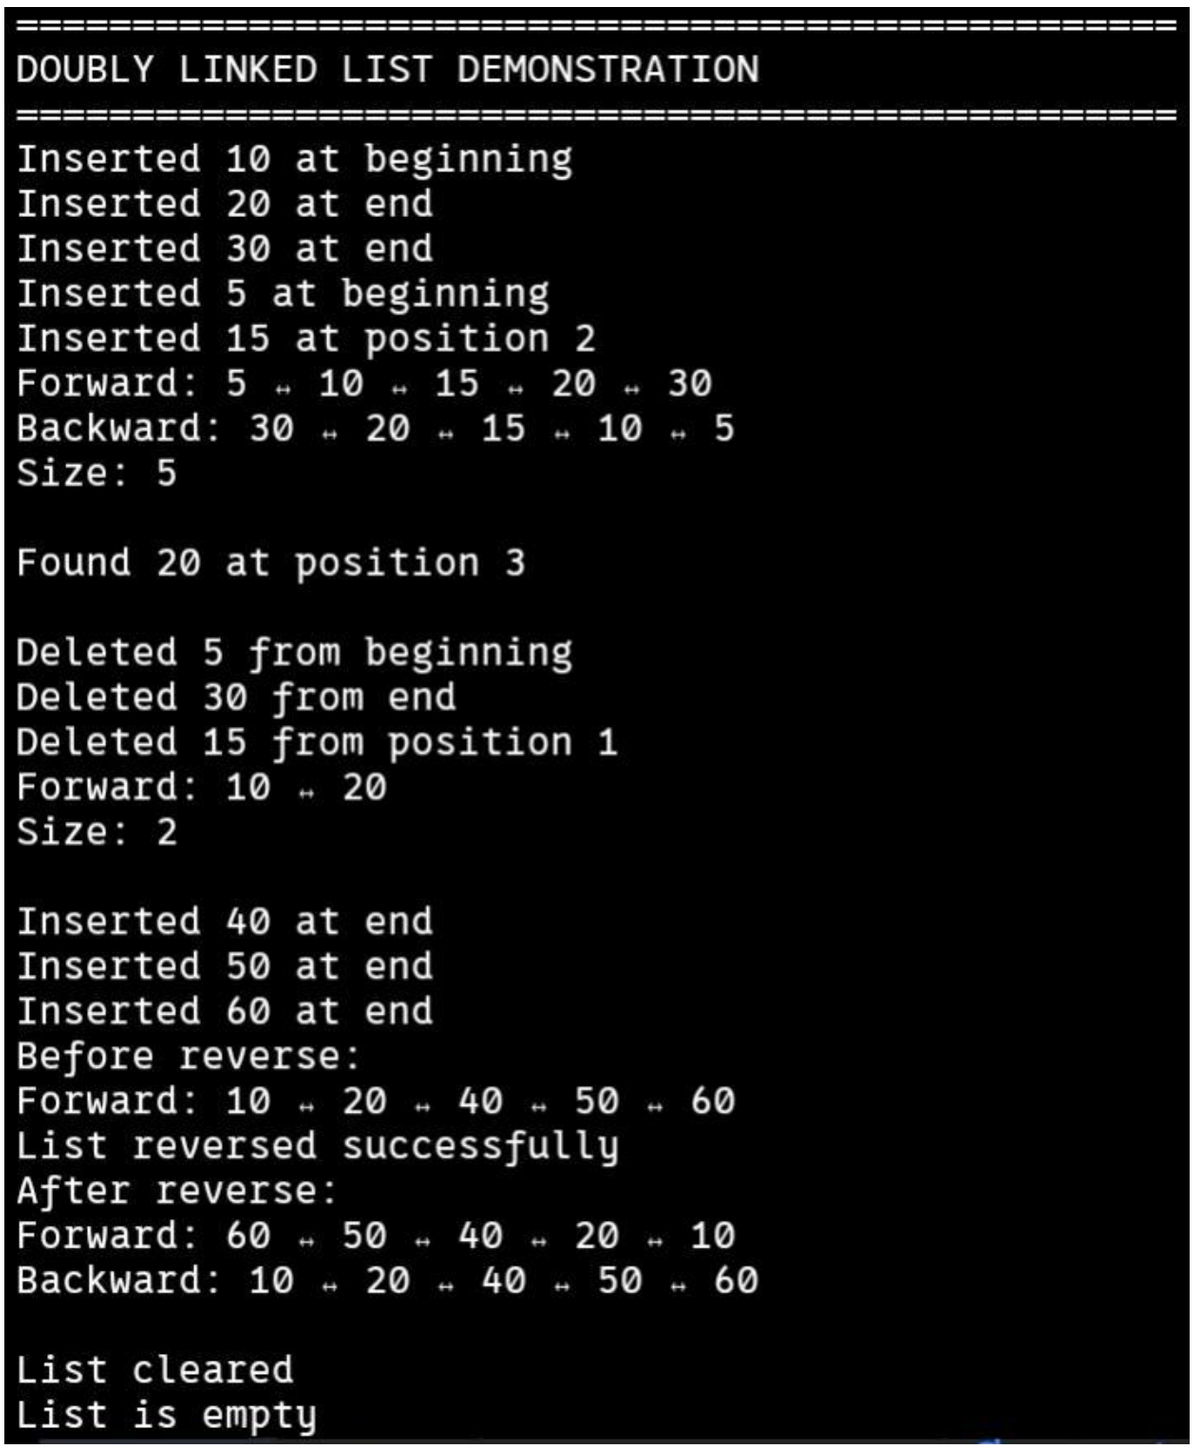

Figure 1 Screenshot of the output.

IV. Conclusion

A doubly linked list is a bizarre concept in DSA (Data Structures and Algorithms). It teaches us how nodes can be grouped together and how to create methods similar to private types of arrays, like being able to append, delete, reverse, and display elements. However, it's not used

very often; it’s only used in certain areas where data needs to be linked together. I can see this concept applied in a blockchain, since each block can be a node, and the chain of them can be the linked list.
